Agenda

- Order to Cash Overview
- Returns Process
- Multi Channel Order Capture
- Validate and Transform Orders
- Price Orders
- Promise Orders

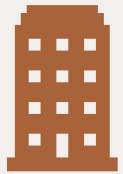

Copyright © 2025, Oracle and/or its affiliates

Overview of Requirement

Functional Scope

- Vision has implemented a full suite of Oracle offerings including HCM, Financials, SCM and CX Cloud.
- Vision has complex requirements across process areas and is requesting the implementation partner to help them with support needed for successful implementation.

vision

Vision Corporation *has a strong presence in US, UK and APAC regions with active presence in other countries as well.*

They have a diversified portfolio of products like hardware, software, computers and accessories manufactured in house, and procured through suppliers as well.

Key Features Requested

- Vision has a large customer base and allows order capture through various modes like
  - Order entry in UI
  - Spreadsheet uploads
  - Omni channel systems capturing the orders to be fulfilled in Order Management cloud
- Vision wants to use Fusion pricing for all order pricing
- Because of the large volume of orders there is also a need to have accurate promising of the orders

Enterprise Structure

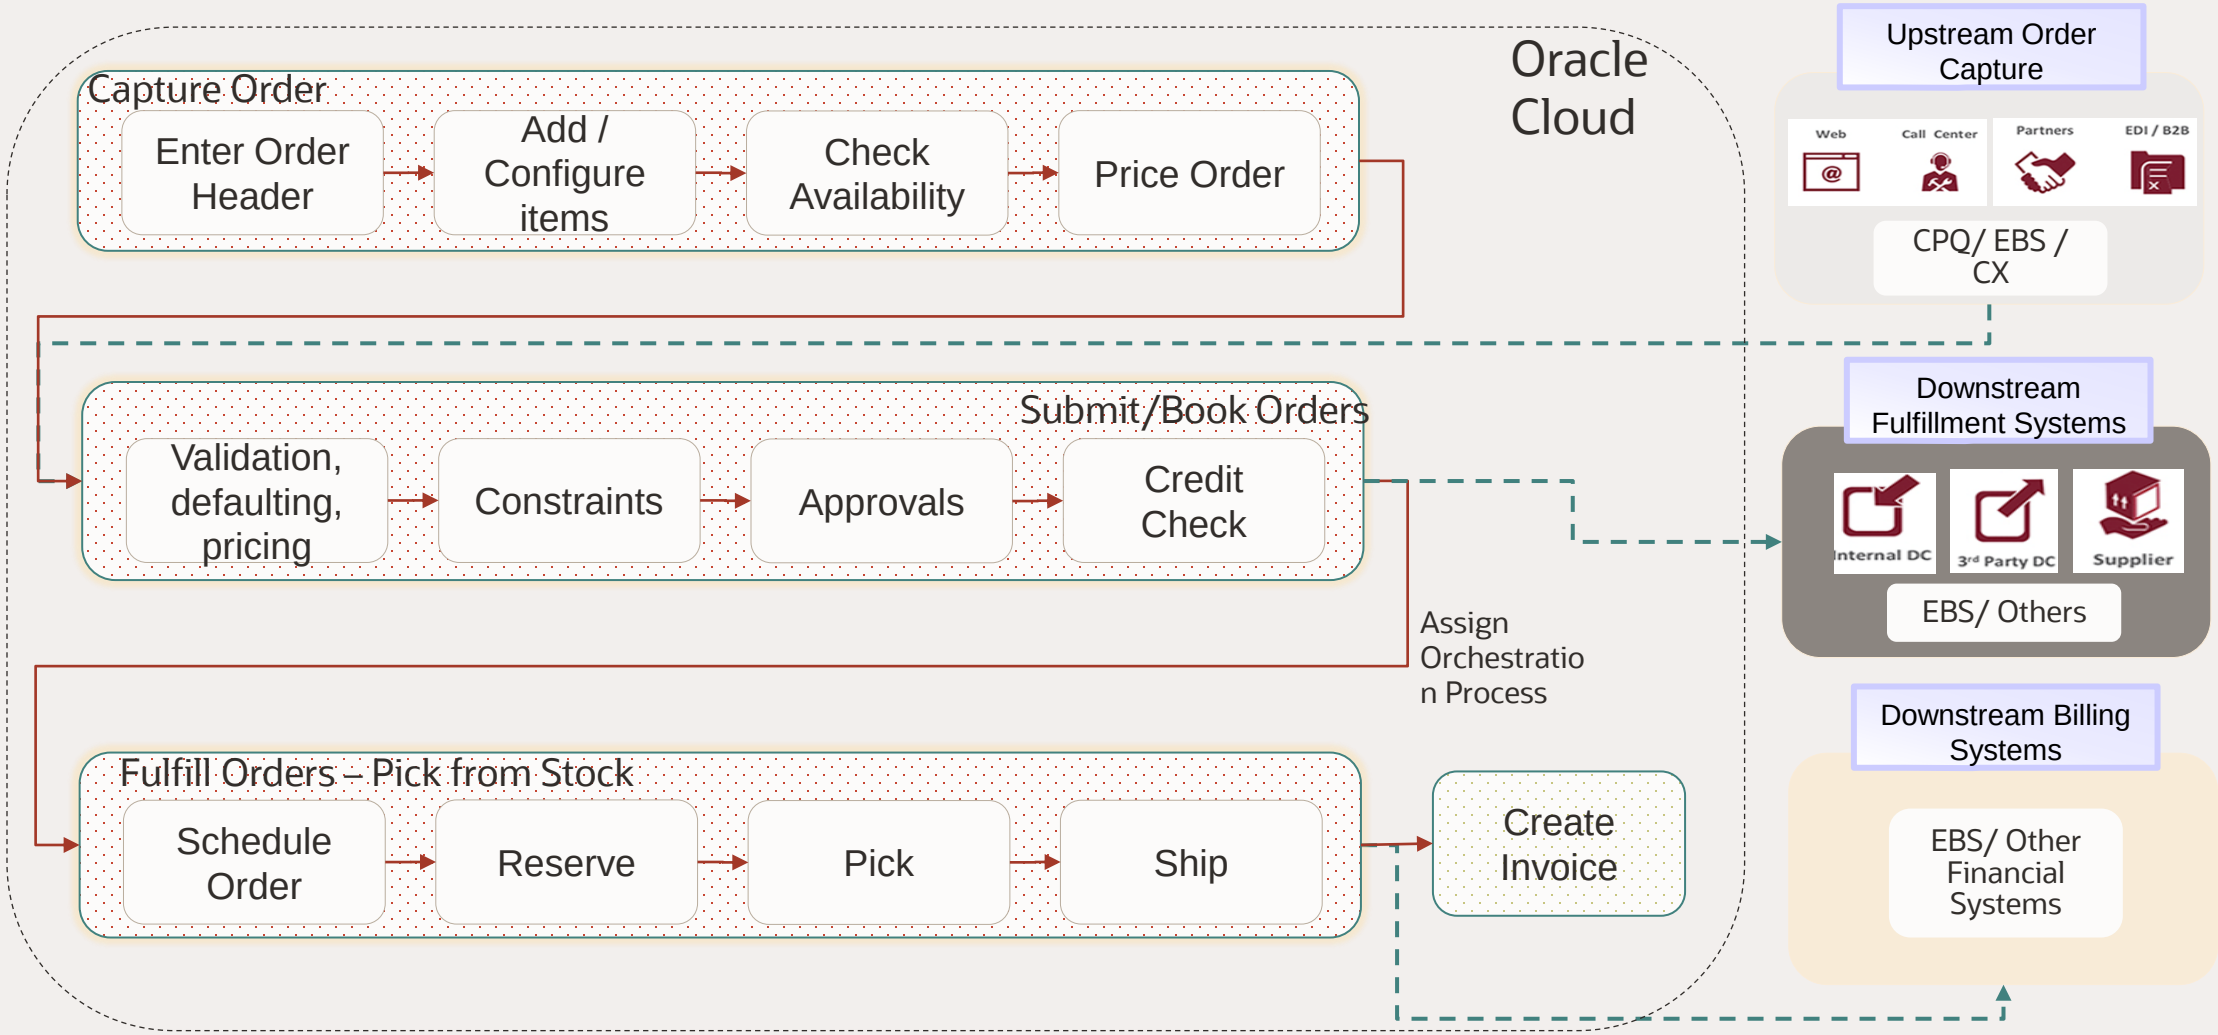

- An enterprise is a collection of legal entities sharing common control and management
- A legal entity is a real-world enterprise structure that has property rights and obligations that can be enforced through courts of law
- Legal entity is responsible for
  - paying and collecting transaction-based taxes;
  - submitting detailed transaction and accounting reports to the authorities;
  - complying with local regulations applicable to financial processing and reporting

- A business unit is an organization within an enterprise that performs one or many business functions that can be rolled up in a management hierarchy
- Use business units for:
  - Processing Transactions
  - Management Reporting
  - Security of Transactional Data
  - Reference Data Definition and Sharing
- Every employee is associated with Legal Entity and Business Unit
- Department has one or more workers assigned to it and they can be associated with cost centers

Order to Cash Process Flow

Copyright © 2025, Oracle and/or its affiliates

Order to Cash Process – Capture and Fulfillment Options

Customer Voice

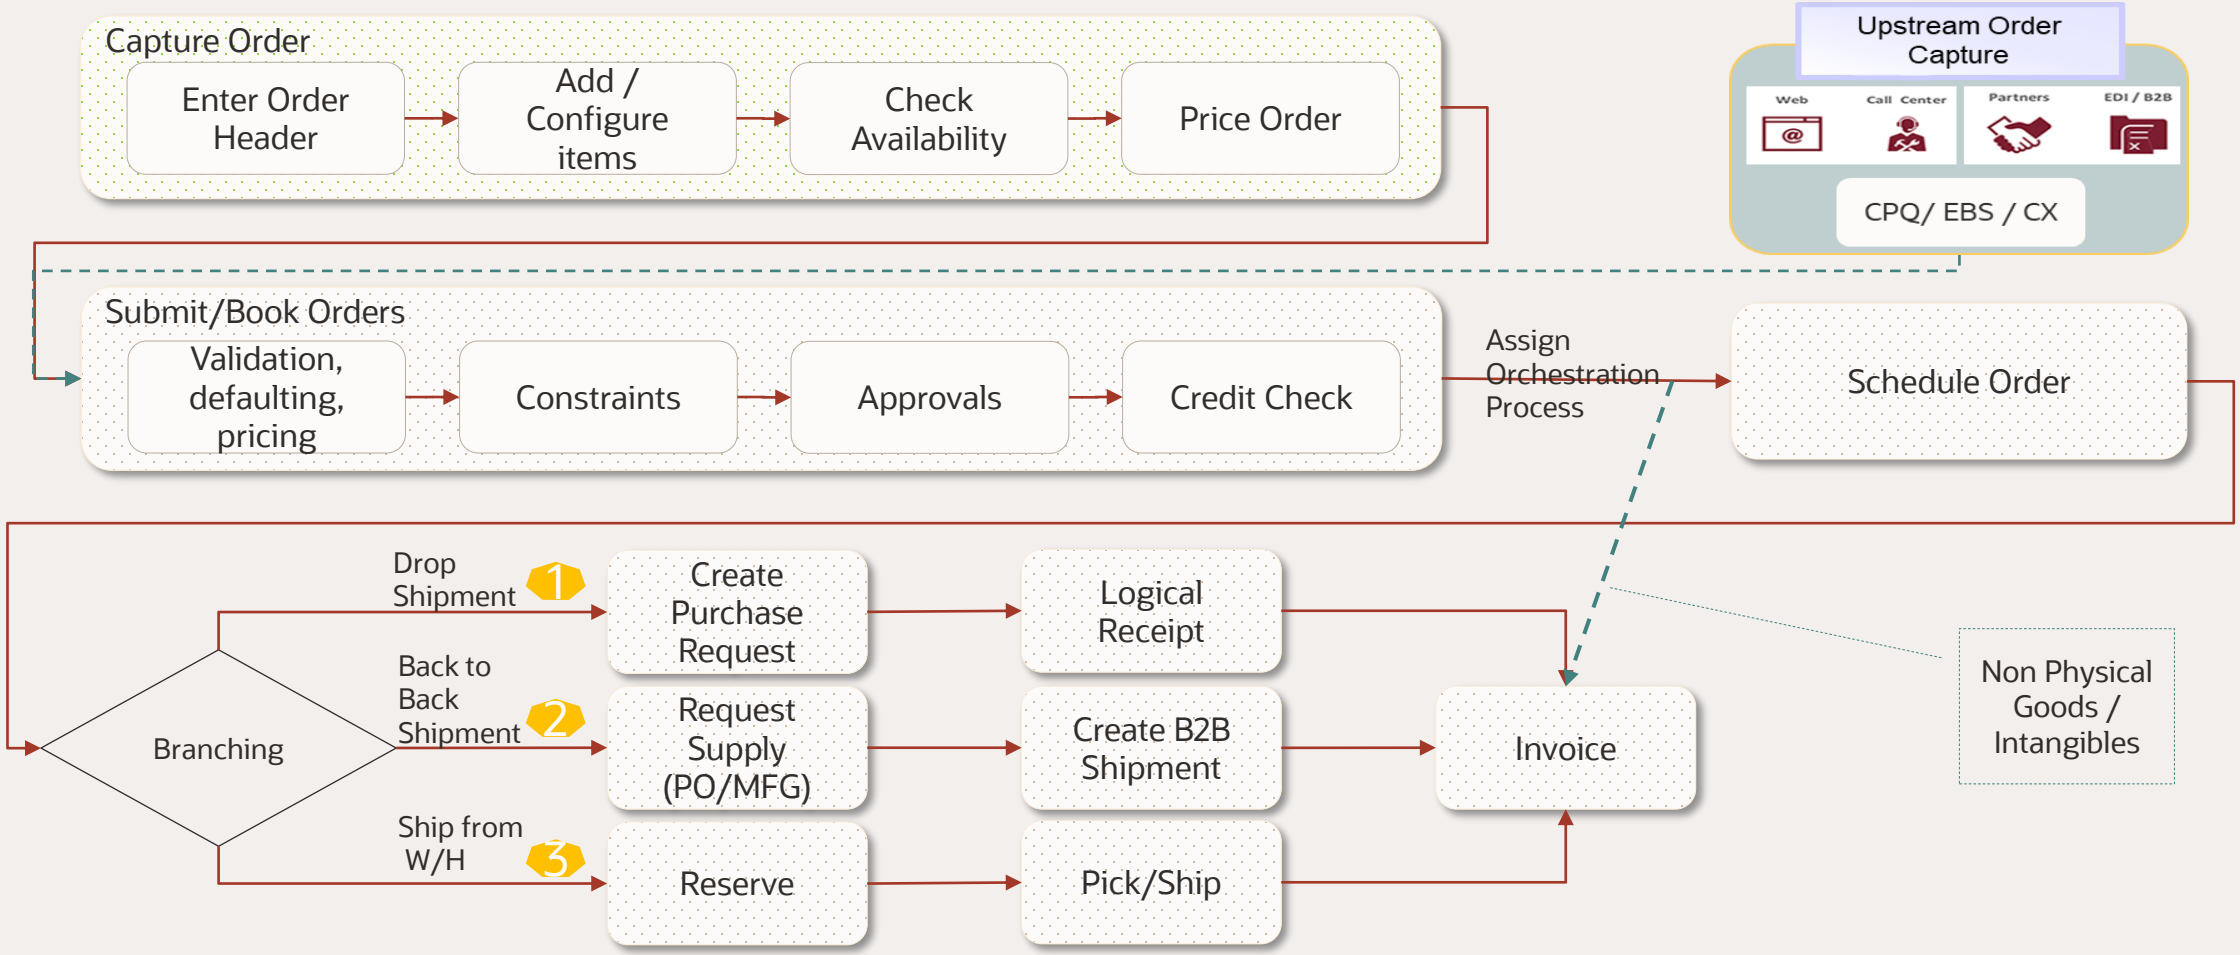

- ✓ How do I capture orders for my hardware products and also provide warranty for them on the same order?
- ✓ Can I ship the physical goods like tablets/computer first and provide the warranty at a later point in time?
- ✓ Can I perform partial shipment and take returns?
- ✓ Can I capture the logistical information like FOB, Shipping method based on the end customer needs?

Agenda for discussion, Demo

- ✓ Order and fulfillment flow variations by products
- ✓ Key differences between the flows
- ✓ Demo - Capture orders and fulfill through UI

Copyright © 2025, Oracle and/or its affiliates

Order to Cash – Capture and Fulfillment Process Branching

Copyright © 2025, Oracle and/or its affiliates

Order Capture and Fulfillment Process – Use Cases

1

Order for physical goods

Enter Order for Physical Goods

Pick, Pack and Ship the physical goods

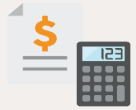

Invoice the customer and perform accounting

2

Order for non-physical goods like Service, Subscription, Warranty

Enter Order for non-Physical Goods

Invoice the customer and perform accounting

3

Create combined order for physical/non-physical goods

Enter Order for Physical Goods and non-physical goods on same order

Pick, Pack and Ship the physical goods

Invoice the customer and perform accounting

Copyright © 2025, Oracle and/or its affiliates

Order Capture and Fulfillment Process – Use Cases

4

Fulfill order using onhand

Capture the order

Pick and pack from available onhand

Ship the goods

Invoice the customer and perform accounting

5

Fulfill order using drop ship

Capture the order

Place the request to the supplier to ship it to the customer

Supplier ships the goods

Invoice the customer

Invoice sent to the customer

Copyright © 2025, Oracle and/or its affiliates

Order Capture and Fulfillment Process – Use Cases

6

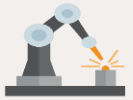

Fulfill order using back-to-back flow

Capture the order

Back to Back Manufacturing request

Complete Manufacturing

Procure the material from the supplier using back to back procurement flow

Pick, Pack and ship the goods

Invoice the customer and perform accounting

7

Configure the order

Configure the order and submit

Fulfill the order using B2B flow

Ship the goods

Invoice the customer and perform accounting

Copyright © 2025, Oracle and/or its affiliates

Order Capture and Fulfillment Process – Use Cases

8

Order capture with Sales Agreement reference

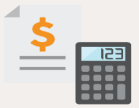

Create a Sales agreement in Contracts offering of type Sale

Create a sales order referencing the agreement

Pick/Ship the product

Invoice the customer and perform accounting

9

Order capture with Project reference

Create the Project and tasks

Create an order referencing the project attributes:task,expenditure org

Pick/Ship the product

Invoice the customer and perform accounting

10

Included Warranty with Service Contracts

Create the sales order for Asset Item

Pick and Ship the product

Create Installed base and Contract record

Invoice the customer and perform accounting

Copyright © 2025, Oracle and/or its affiliates

Next Gen Order Management-Redwood

Next Gen Order Management is a new Redwood user experience for the creation and management of sales orders.

Redwood Experience

Fast search

Ability to search by any attribute and bring data back quickly. Use keywords to be able to pull up the orders you want efficiently.

Configurable Search

Configure attributes that participate in keywords, filters, and search results, and create your own search views

Fast Scrolling

Scroll through your orders without pagination delay after a batch of records is retrieved

Mass Actions & Mass Update

Update attributes on order lines across orders

Take actions across orders or lines

Copyright © 2025, Oracle and/or its affiliates

Order Capture and Fulfillment Process – Use Cases

Order for physical goods

Enter Order for Physical Goods → Pick, Pack and Ship the physical goods → Invoice the customer and perform accounting

Demo- Redwood

The order entry specialist Karen gets a request to create an order for a product (tablet/laptop)

Karen needs to use the Order Management Redwood UI to create the order with the product

Agenda for discussion / demo

- ✓ Order creation process using Redwood
- ✓ Using Customer Name / Customer Number or Customer Ship while Order Entry
- ✓ Defaulting of business
- ✓ Visibility of EFF on the Order Page like regular fields
- ✓ GenAI capability for Order Acknowledgement email
- ✓ Viewing fulfillment line details from Order Line

Copyright © 2025, Oracle and/or its affiliates

Order Capture and Fulfillment Process – Use Cases

Create combined order for physical/non-physical goods

Enter Order for Physical and non-physical goods on same order

Pick, Pack and Ship the physical goods

Invoice the customer and perform accounting

Demo

The order entry specialist Karen gets a request to create an order for a product (tablet/laptop)

The customer has also requested for an extended warranty for the product

Karen needs to use the Order Management UI to create the order with the product and the corresponding warranty

Agenda for discussion / demo

- ✓ Types of orders
- ✓ Types of products that could be used on the orders
- ✓ Order entities – headers, lines, fulfillment lines
- ✓ Perform order capture
- ✓ Covered Item, Coverage Item

Copyright © 2025, Oracle and/or its affiliates

Pre-requisites to Interface eligible OM Line to Subscription

Enable Opt In Features

- ✓ Offering: Sales
- ✓ Integrate Order Management with Subscription Management to Process Subscriptions
- ✓ Integrate Order Management with Subscription Management to Process Coverages

Configurations

- ✓ Create Order Type for Subscription Sales
- ✓ Create Process Assignment rule to assign to assign standard Orchestration Process for the new Order Type
- ✓ Standard Orchestration Processes are
- ✓ DOO_ProductFulfillmentWithIntegratedSubscription
- ✓ DOO_IntegratedSubscriptionOnly

- ✓ As an alternative, create your own orchestration process and add the subscription step

Copyright © 2025, Oracle and/or its affiliates

Enable Next Gen Order Management

Create and Manage Sales Orders

- ✓ Opt-In to the feature
- ✓ Configure Index in PIM

Product Management > Manage Commercial Items

Oracle Fusion Cloud Order Management 24D What's New

Search and Apply Actions on Multiple Sales Orders

- ✓ Opt-In to the feature
- ✓ Create your search index
- ➢ Manage your search indexes
- ➢ Set up your search view

➢ Signifies Optional Steps

If you are satisfied with the default search experience, then you don't need to do the optional steps.

If you plan to use an extensible flex field as part of the search, then you must do the optional steps.

Order Capture and Fulfillment Process – Use Cases

4

Return order for credit

Create the return order → Route through approvals if any → Create the credit memo

Demo

The order entry specialist Karen had earlier created a order for product along with warranty

The customer has reached out to her to return the product as the package was completely damaged during transit

Karen needs to use the Order Management UI to refer to the sales order and create a return order

Agenda for discussion / demo

- ✓ Types of return orders
- ✓ Create referenced and unreferenced return orders

Copyright © 2025, Oracle and/or its affiliates

Implementation Considerations

Return order - without reference

- ✓Customer implemented OM Cloud and did not do conversion of all old sales orders (say older than 6 months). There could be some adhoc returns for the sales orders which were not converted. So return orders without reference need to be created
- ✓ Large # of returns : Oracle Cloud OM has been implemented since some time now and later a large number of returns came for a specific product. To simplify order entry, billing, and through agreement with the customer to credit all items at the same price. The Order Entry Specialist uses the Order Management work area to create a single unreferenced return order for all the returned items. This approach allows the Order Entry Specialist to complete the return without having to spend many hours looking up the original sales order for each item.
- ✓Accept returns for items sold by some other company (like a refurbished reseller) - accept items that their customer purchased from a competitor as part of a promotion to sell new laptops. Enter these items as unreferenced returns, then sells them later as refurbished.

Return Order - Cancel

- ✓ Cancel an item that doesn't include a shipment. For example, a contract for wireless phone service typically doesn't include a shipment. The customer can't physically return it, but you can cancel it
- ✓ Coverage and subscriptions can also be cancelled

Copyright © 2025, Oracle and/or its affiliates

Key Order Management New Features – 25B

✓ Order Management

- Create Guided Journeys for FAQs in Order Management
- Redwood: Link Return Lines to Original Orders
- Redwood: Refine Data Security for Sales Orders
- Redwood: Specify Representatives on Sales Orders
- Redwood: Split Lines When You View or Search Orders
- Redwood: Update Additional Attributes on Multiple Order Lines
- Redwood: Check Availability
- Redwood: Reduce Inventory When You Don't Pick or Ship
- Close Sales Orders That Remain Open
- Use Promotion Codes to Determine Whether Orders Are Eligible for Promotions

Multi Channel Order Capture and Import – Overview

Customer Voice

- ✓ Can I create the order in an external legacy system and fulfill it using OM Cloud?
- ✓ Do I always need to enter the order through the OM Order UI?
- ✓ How can I upload orders in bulk from external channels?
- ✓ Can my trading partners send me the orders?
- ✓ Can I price my orders in external system and retain the pricing in OM Cloud?
- ✓ Can I use the OM cloud pricing for my channel orders?

Copyright © 2025, Oracle and/or its affiliates

Integration options are available in Oracle Order Management for Order creation

Inbound Channel Upstream

- **File-Based Data Import (FBDI)**

  Recommended for large volumes of orders. Enables asynchronous automated integration between systems

- **REST Stage Order**

  Stages orders in real time, order by order, into the interface tables.

  If a REST API call to stage the order runs for more than 5 minutes, it might produce a 504-gateway time-out error

- **REST Create Order**

  Use this integration option to create orders in real time. Recommended for small orders

- SOAP Create Order

As there are plans to deprecate SOAP services, we recommend that customers use one of the other integration options to create and import orders

Integration Playbook	:Overview of Integration Types and Options (oracle.com)
REST API	: REST API for Oracle Fusion Cloud SCM - Sales Orders for Order Hub Requests REST Endpoints
Customer Connect	:Session Replay: Oracle Cloud SCM Integration Playbook - Part 3 (Order Management) — Partner Community

Multi Channel Order Capture – Use Cases

1

Order received by call center

Note the customer, item, quantity and fulfillment dates for the order

Copy from earlier order or create order from scratch

Verify the quantity and price

Validate and submit the order

2

Order captured from web

Order created and submitted from web system

Order creation request through web services

Order transformation and validation

Order validation and creation of order in Cloud OM

3

B2B Order

Order created by the trading partner

Process the order through the collaboration messaging framework

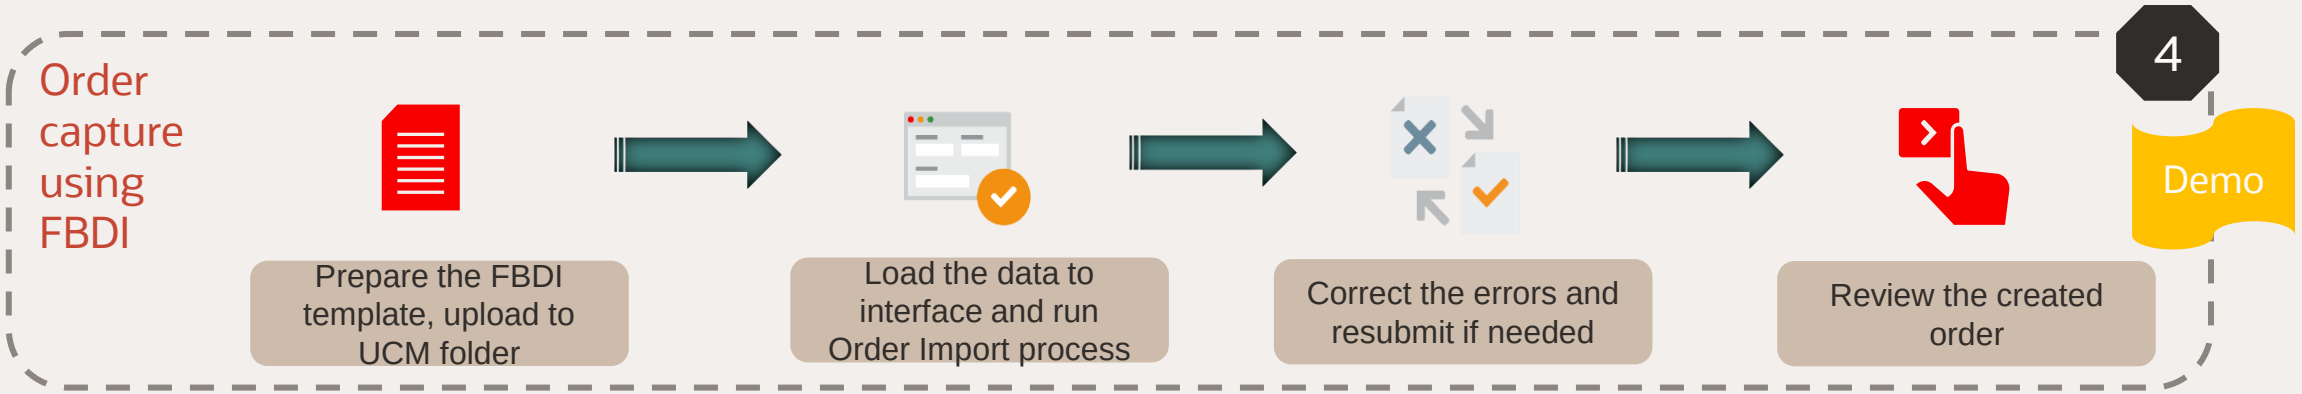

Order transformation and validation

Order validation and creation of order in Cloud OM

Copyright © 2025, Oracle and/or its affiliates

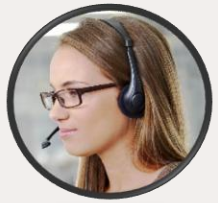

Multi Channel Order Capture – Use Cases

Agenda for discussion / demo

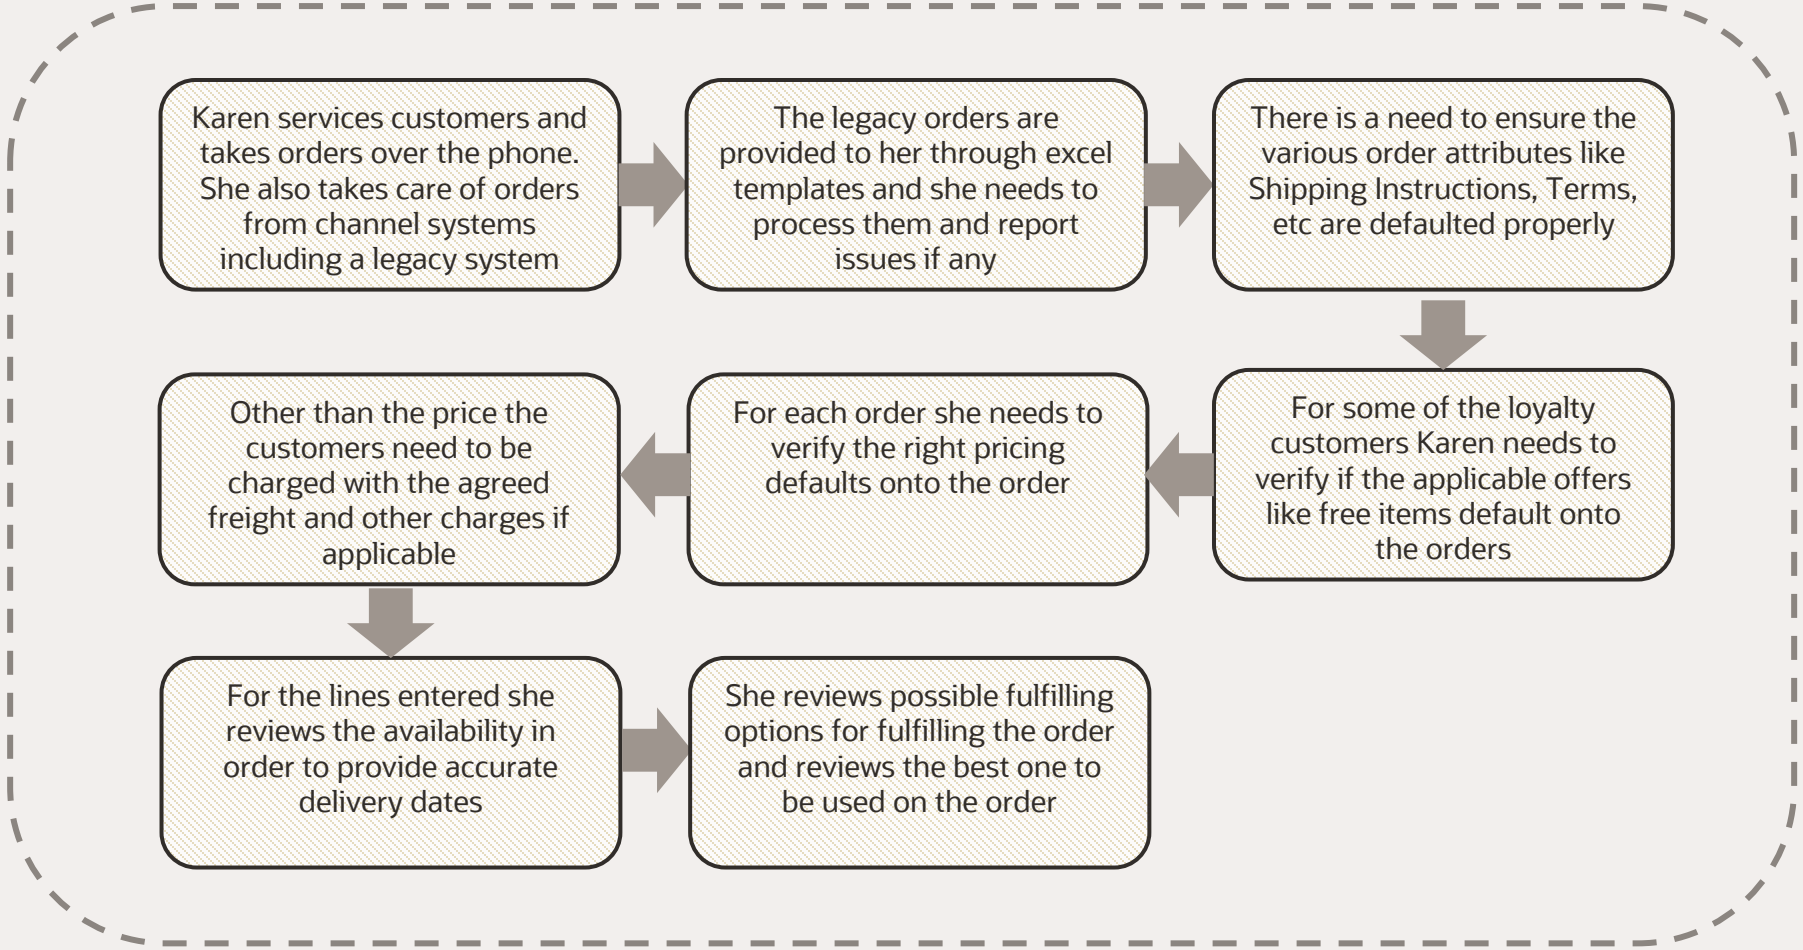

- ✓ Process to create the FBDI
- ✓ Order entities that can be imported
- ✓ Steps to upload the FDBI to create sales orders
- ✓ Demo – Order Import using FBDI

Multi Channel Order Capture to Promise-Use Case

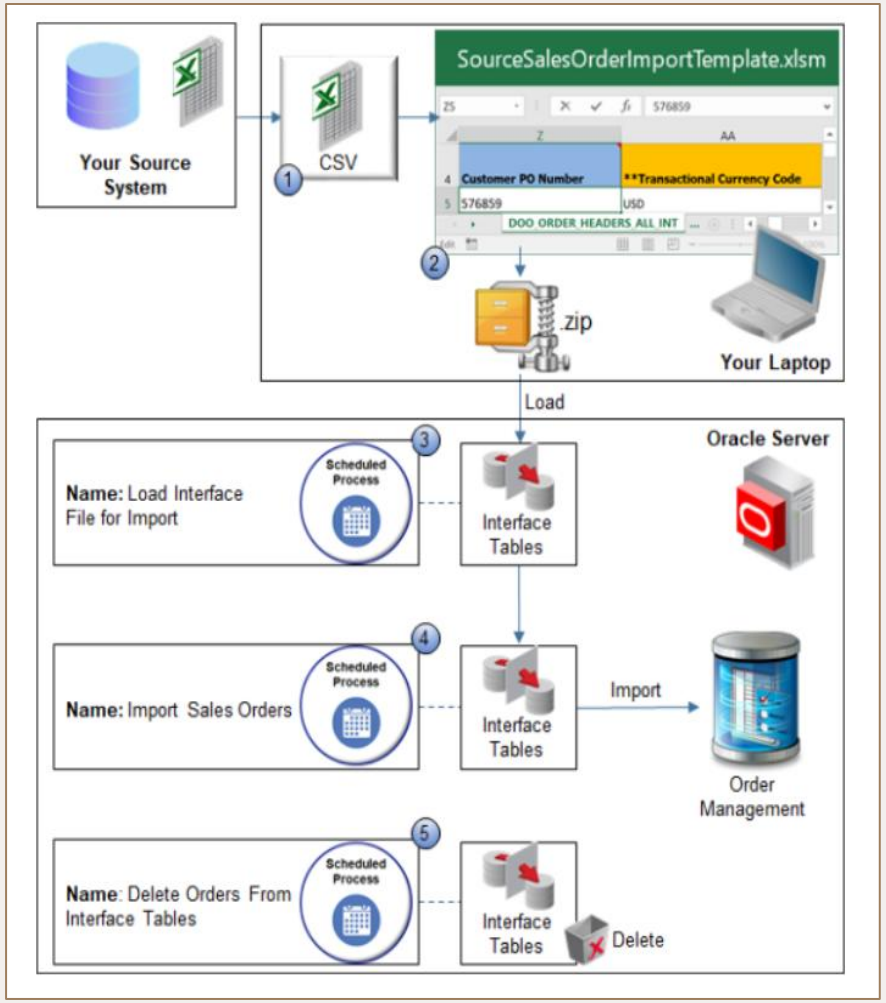

Karen is a customer service representative who creates customer orders and manages order exceptions.

Ensuring orders are captured without errors and the right price along with accurate delivery dates to customers helps maintain customer responsiveness.

Copyright © 2025, Oracle and/or its affiliates

Order Import Process - File Based Import Steps

Reference – Master Note 2665940.1

Steps

01 Convert source data into CSV file: This data can then be ported to the Sales Order Import template. Optionally you can also start from step 2 if you are directly updating the order import data into the spreadsheet.

02 Create import file as per the template:

- ✓ Download the latest template from https://docs.oracle.com/en/cloud/saas/supply-chain-management/XYZ/oefsc/order-management.html#order-management replacing XYZ with the desired version say 20b
- ✓ Update data into the various worksheets and generate the zip file

03 Run the ESS process “Load Interface File For Import”

04 Run the ESS process “Import Sales Order”

05 Examine the log file to determine success or failure for individual orders and to identify errors. If orders are successfully processed the data is deleted from the interface tables

Copyright © 2025, Oracle and/or its affiliates

Implementation Considerations

Setups

- ✓ Functional Setup Manager – Offerings, Features
- ✓ Manage Order Profiles – Profile name “Retain Sales Order Number For Orchestration Order Number”
- ✓ Manage Document Sequence (can update starting #)
- ✓ Manage Order Lookups
  - Order Types : ORA_DOO_ORDER_TYPES
  - Return Lines : ORA_DOO_RETURN_LINE_TYPES
  - Shipment Lines : ORA_DOO_LINE_TYPES
- ✓ Manage Trading Community Source Systems
- ✓ Manage Upstream and Fulfillment Source Systems

Integrations

- ✓ Upstream – CPQ, EBS, Other Systems
- ✓ Downstream – 3PL Systems, EBS, Other Systems, Billing, Invoicing Systems
- ✓ Custom Integration work could be involved in some of the above integrations

Data Conversion

- ✓ Master Data – Customers, Items, Pricing
- ✓ PIM – Items with corresponding attributes
- ✓ Pricing Strategies, Price Lists
- ✓ ATP – Sourcing Rules
- ✓ Open Orders Conversion (FBDI / Web services)

Analytics and Processes

- ✓ OM Landing Page Infolets
- ✓ ESS - Update or Close Sales Orders
- ✓ ESS - Delete Orders from Interface Tables

References

- ✓ FA: SCM: OM: Customizing Order Number Sequencing and Generation (Doc ID 2129508.1)

Copyright © 2025, Oracle and/or its affiliates

Agenda

- Order to Cash Overview
- Returns Process
- Multi Channel Order Capture
- **Validate and Transform Orders**
- Price Orders
- Promise Orders

Copyright © 2025, Oracle and/or its affiliates

Validate Orders

Order Management automatically validates your sales order when you click Submit, but you can also manually validate it before you click Submit.
Validation examines the order for:

- ✓ Possible errors
- ✓ Processing Constraints
- ✓ Pricing and tax configuration

Validation without error	Validation with error
Confirmation message, so the order can then be submitted	Fix each error that the Error dialog displays, then click **Validate** again.
	Order Management adds an error or warning icon to the order header immediately to the left of the Total attribute, and to each order line that contains an error. It also keeps the sales order in Draft status. Click the warning icon to get details about the error.

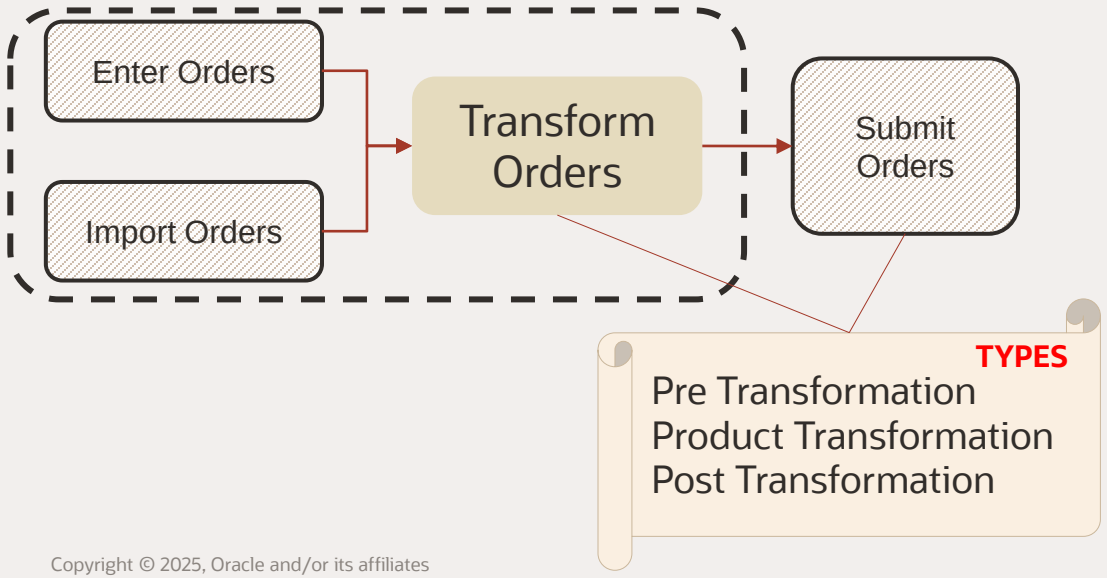

Copyright © 2025, Oracle and/or its affiliates

Transform Orders

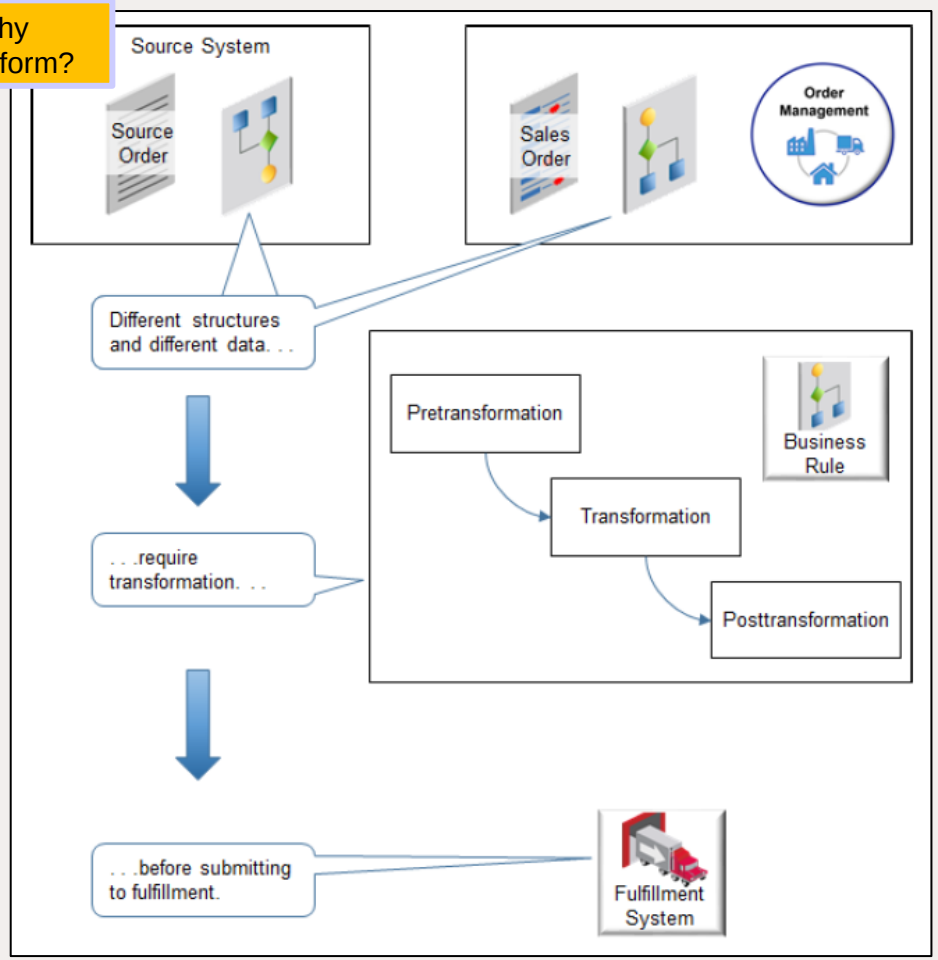

Write a business rule that populates order attributes before OM transforms a source order, while it transforms a source order, and after it transforms a source order

Customer Voice

- ✓ How can I build system controls to standardize my orders coming from the channel systems to avoid import errors
- ✓ Can I specify an additional packing instruction for fragile items
- ✓ Can I add additional items along with item from the source system
- ✓ Can I explode the source item into multiple other items?
- ✓ How do I convert source order line UOM of CM to Inches for my Cloud OM order?

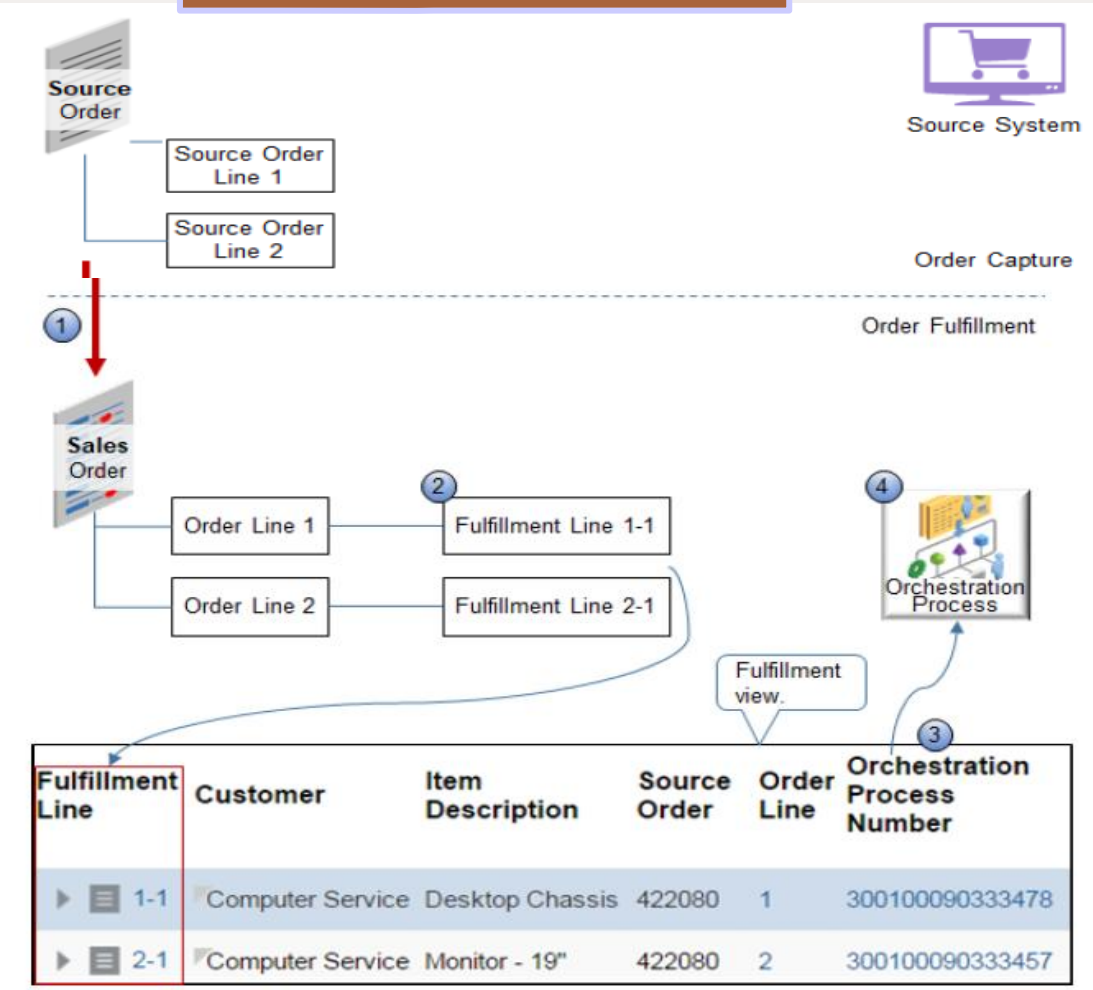

Why Transform?

Copyright © 2025, Oracle and/or its affiliates

Product Transformation Overview

Source Sales Order vs Transformed Order

Product Transformation

- Item relationships
- Item Structures
- Transactional item attributes
- Oracle Business Rules

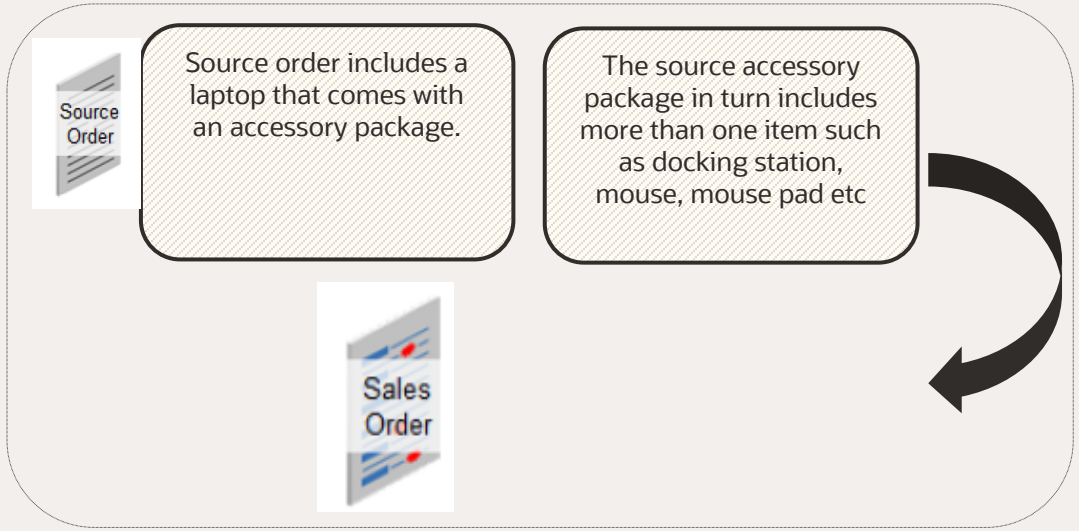

Product Transformation Scenarios

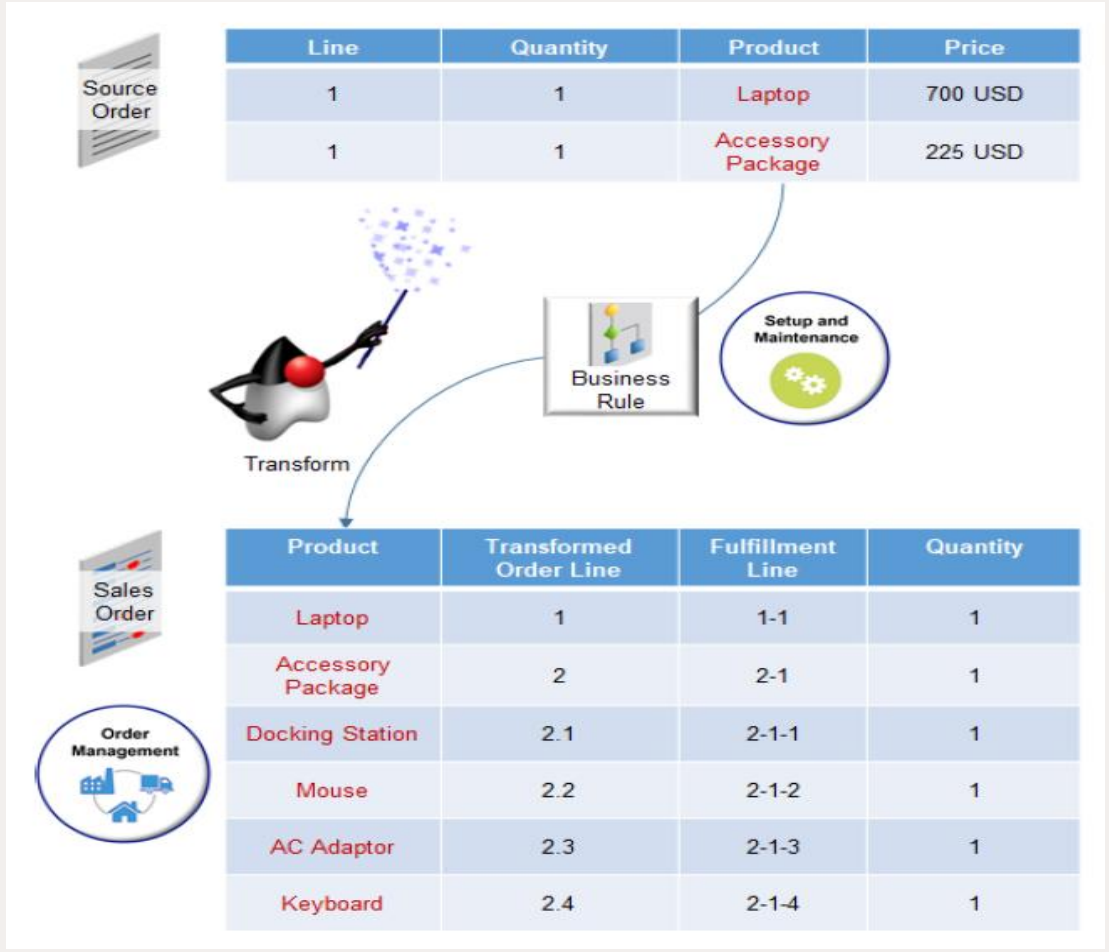

- Product to Product
- Product to attribute
- Attribute to Product
- Attribute to Attribute
- Context to Product
- Context to Attribute

- ✓ Transformed orders contain the information that is necessary to fulfill an order, for example, customer, item, and quantity
- ✓ A transformed order doesn't necessarily mirror the original sales order.
- ✓ Fulfillment lines also are created. All action in Order Management is taken on fulfillment lines.

Product to Product Transformation – Demo Use Case

Demo

Add a free screen protector whenever the customer is GOLD type

Capture the order header with the customer type “Gold”

Select the item on the order

Validate and submit the order

The free screen protector should get added

Karen the order entry specialist manages the order entry for various channels.

She has received the order request for customer who is of Gold Loyalty status. The customer has ordered a tablet.

Karen reviews the product transformation rule and creates an order for the tablet.

Agenda for discussion / demo

- ✓ Types of transformation
- ✓ Post-transformation invoking method
- ✓ Post transformation rules using Oracle Business Rules (OBR)
- ✓ Demo – Product-transformation rule and defaulting

Copyright © 2025, Oracle and/or its affiliates

Pre transformation – Use Cases

1

Default a ship method based on item

Capture the order header

Provide the item for which ship method needs to default

Confirm the required default ship method is updated onto the order

Validate and submit the order

2

Default the request date to sysdate+1

Create the order header through the UI

Provide the item, for which defaulting is needed

Order transformation and defaulting of request date

Validate and submit the order

3

Update the UOM from inches to cm for a specific order type

Create the order header through the UI

Provide the order type

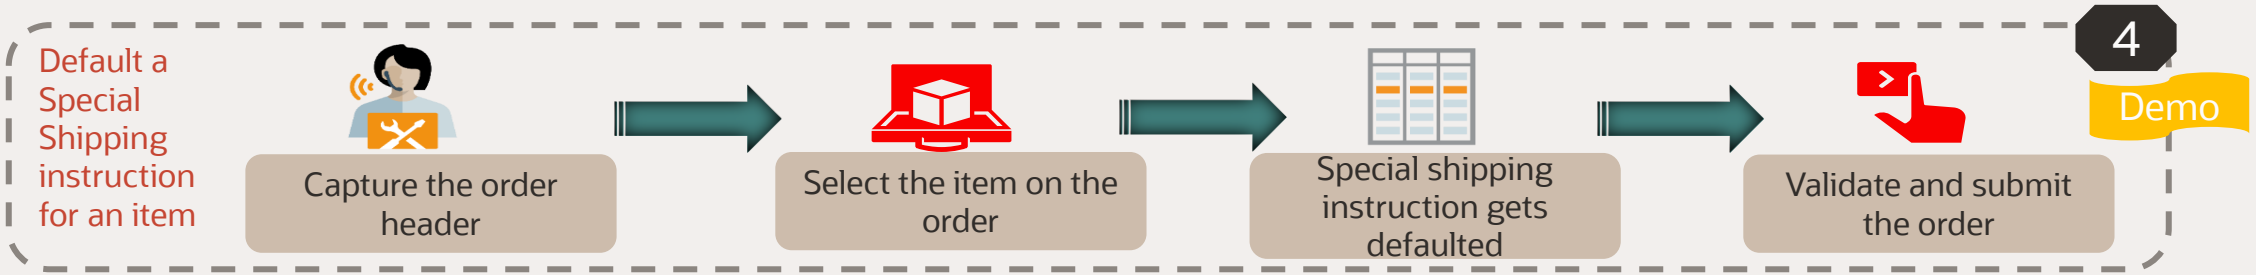

UOM gets updated to cm

Validate and submit the order

Copyright © 2025, Oracle and/or its affiliates

Pre transformation – Use Cases

Karen the order entry specialist manages the order entry for various channels including a legacy system

There is a requirement to default a Special Packaging Instruction for a specific customer and item

Karen builds the pre-transformation rule to take care of this requirement

Agenda for discussion / demo

- ✓ Types of transformation
- ✓ Pre-transformation invoking method
- ✓ Re-evaluation of pre-transformation on modifying Customer, order type or adding a new line
- ✓ Demo – Pre-transformation rule and defaulting

Pre transformation rules are triggered when:

- Customer details are entered or modified
- Order type is entered or modified
- Order Line is added

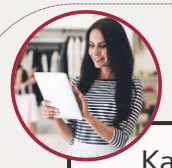

Copyright © 2025, Oracle and/or its affiliates

Post Transformation – Demo Use Case

Over-ride the default shipping instruction for a legacy order

Demo

Capture the order header → Select the item on the order → Special shipping instruction gets defaulted → Validate and submit the order → Validate the new Shipping Instrn

Karen the order entry specialist manages the order entry for various channels including a legacy system

There is a requirement to default a Special Packaging Instruction for a specific customer and item

But if the order for the same item comes from a legacy system then a different legacy packing needs to be used

Karen sets the post-transformation rule to take care of this requirement

Agenda for discussion / demo

- ✓ Types of transformation
- ✓ Post-transformation invoking method
- ✓ Post transformation rules using Oracle Business Rules (OBR)
- ✓ Demo – Post-transformation rules and defaulting

Copyright © 2025, Oracle and/or its affiliates

Pre, Post Transformation – Use Case working

Orders shipped for ABC Application for some of the items need to use New Shipping Labels. But if the order source is a Legacy system then the Shipping Instruction should be updated to “Legacy Shipping

Create Order - UI

Create sales order using UI for ABC Customer and a specific item

Order 999 – ABC Application	Item	Shipping Instruction
Fulfillment Line 1	Tablet	New Shipping Label

Prior

Create Pre transformation defaulting rules

Enter Order > Shipping Instruction – New Shipping Label

Unless overwritten by the user the shipping instruction stays on the order

Book the Order

Import Legacy Order

Order imported from Legacy system for the same Customer and item

Order 1000 – ABC Customer	Item	Shipping Instruction
Fulfillment Line 1	Tablet	Legacy Shipping Label

Post

Create Post transformation defaulting rules

Enter Order > Shipping Instruction – New Shipping Label

Submit the order

The defaulted shipping instruction now gets overwritten with “Legacy Shipping Label” even if the shipping instruction is overwritten by the user

Copyright © 2025, Oracle and/or its affiliates

Implementation Considerations

When does transformation get invoked? – Doc ID 2660075.1

Setup Tasks

- ✓ Manage Pretransformation Rules for Sales Orders
- ✓ Manage Product Transformation Rules
- ✓ Manage Posttransformation Defaulting Rules

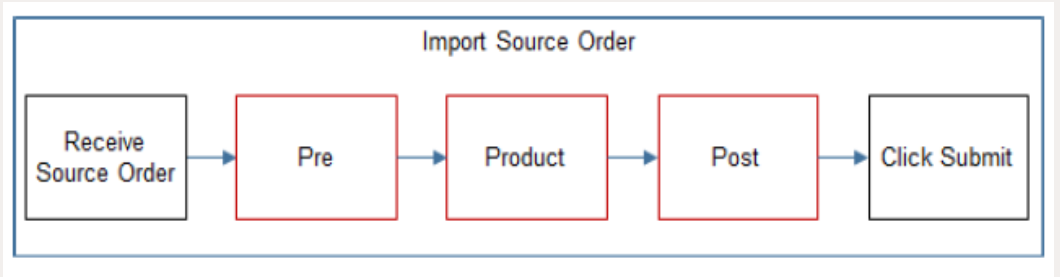

Additional Configuration

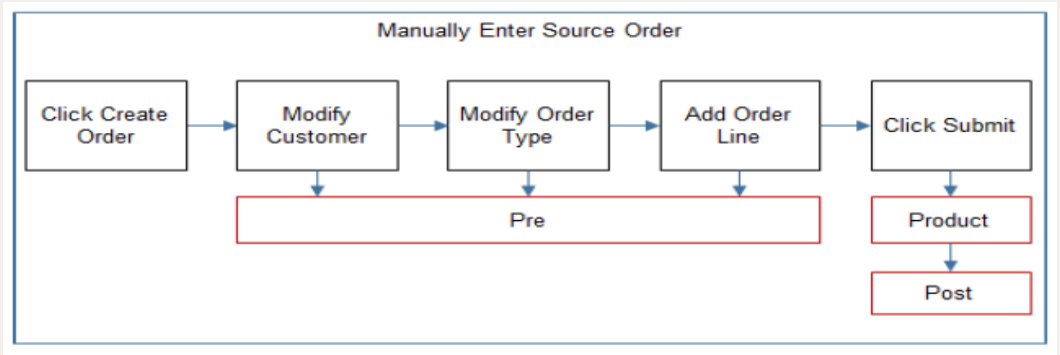

Oracle Business Rules

- ✓ Rule conditions
- ✓ Rule actions
- ✓ Facts
- ✓ Bucket sets
- ✓ Dictionaries
- ✓ Decision tables

Run rules when they apply

- ✓ Order Management work area – OM only runs transformation rules and post transformation rules on order lines
- ✓ Web service or the order import - OM runs transformation and post transformation rules when it validates the draft sales order during import. It runs these types of rules on both order lines and return order lines
- ✓ No pre-transformation on order revision for orders entered in UI, post transformation can be used in such cases

* Referenced Return orders do not trigger any transformation rules when submitting an order
* Pre, Product and Post Transformation rules do not apply for orders created through REST, instead OM Extensions need to be used

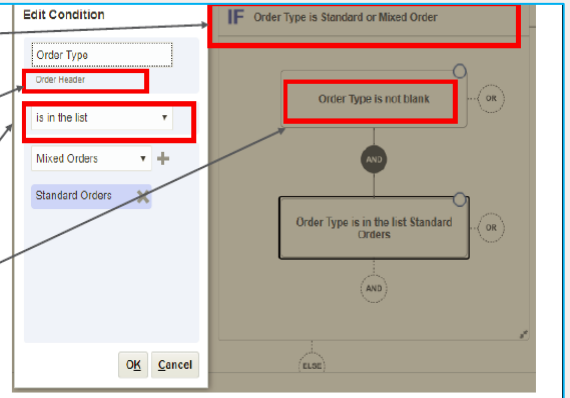

FA: SCM: OM: Master Note - Transforming Data on Sales Orders Using Pre, Product and Post Transformation Rules (Doc ID 2675921.1)

Copyright © 2025, Oracle and/or its affiliates

Oracle Business Rules (OBR) - Considerations

Visual Information Builder

- ✓ **Write descriptions** for the IF and THEN
  This way you do not have to open up the blocks every time you want to know the condition or action
- ✓ Pay attention to the entity
  There are number of attributes which exists on order and fulfillment line
- ✓ Use operator "Is in the list"
  Rather than writing number of OR conditions
- ✓ Check for not null (Blank)

Extensible Flexfields

Tips and Best Practices

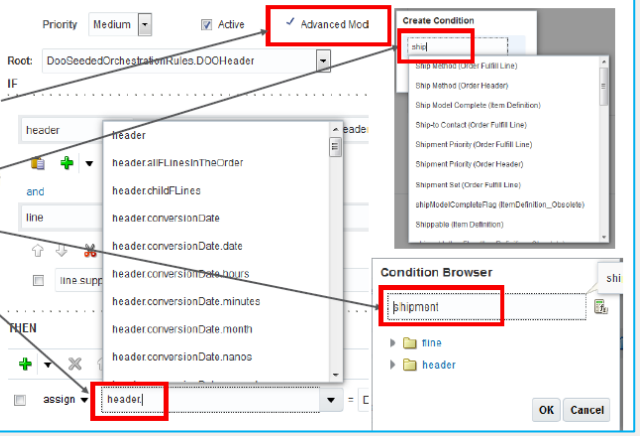

- ✓ Include "not null" checks for attributes
- ✓ Use the Context Code
- ✓ Use the Segment API Name

Native OBR

Tips and Best Practices

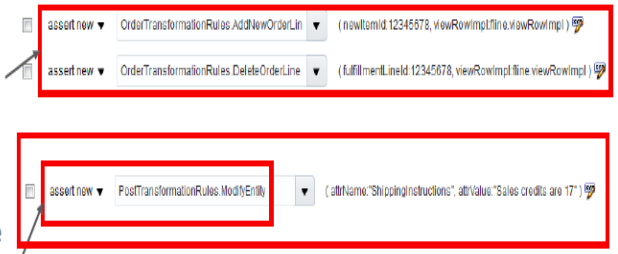

- ✓ Use **Advanced Mode** and **Tree Mode** where available
- ✓ **Type partial text** to get the filtered list of values in expressions

Transformation Rules

Tips and Best Practices

- ✓ Product Transformation is used to add new lines or delete lines
- ✓ Post transformation is used to change the attributes on the newly added line
- ✓ Use **assert new** action with **ModifyEntity** Function to **set values**

Copyright © 2025, Oracle and/or its affiliates

Agenda

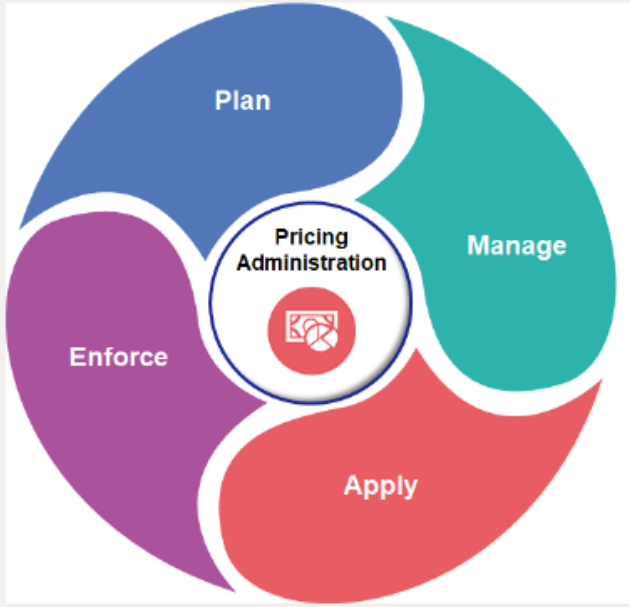

- Order to Cash Overview
- Returns Process
- Multi Channel Order Capture
- Validate and Transform Orders
- **Price Orders**
- Promise Orders

Copyright © 2025, Oracle and/or its affiliates

Pricing Overview

Plan pricing strategies so they align with your business objectives. Use characteristics of your customer, the item, and the buying context to identify market segments.

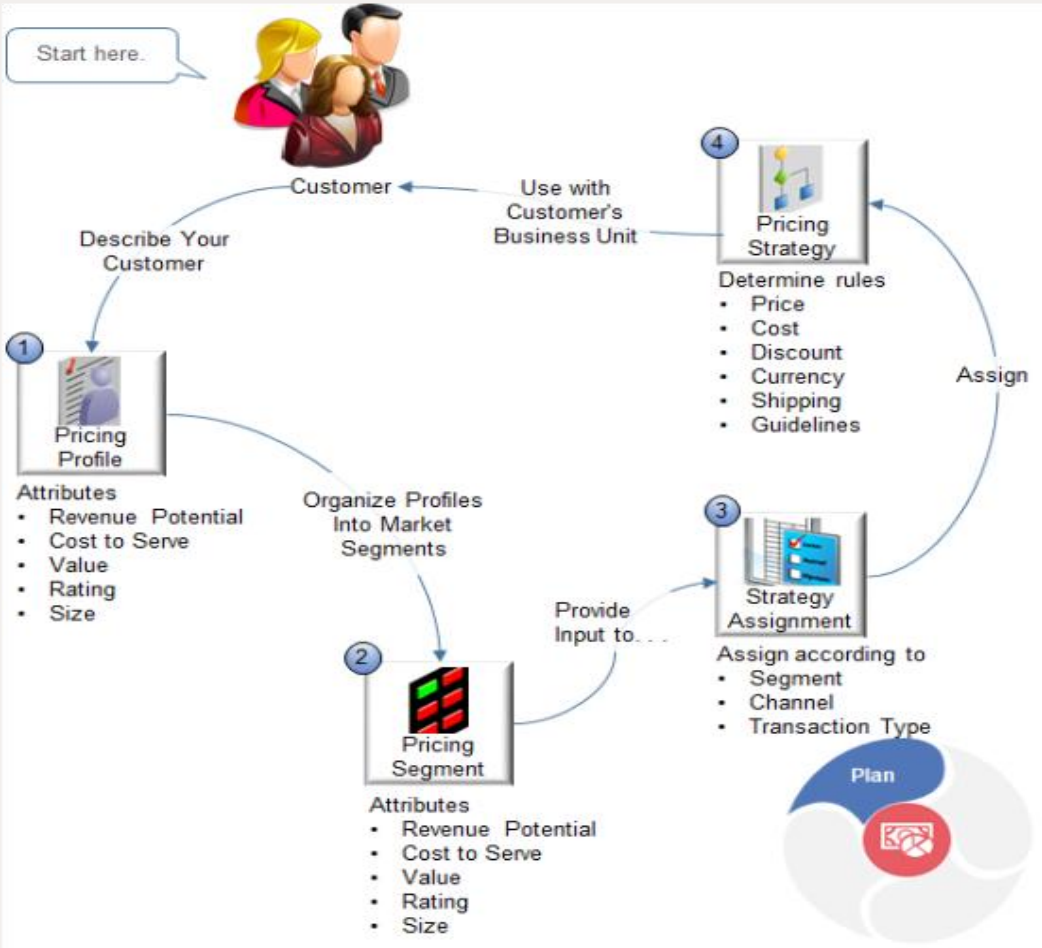

Manage the pricing rules that control how Pricing applies a price adjustment. For example, administer a discount on the list price of an item.

Enforce spending limits to prevent an excessive discount. Make sure pricing is accurate so it meets your corporate revenue and margin objectives.

Apply common pricing logic across all sales channels. Achieve consistent and accurate pricing throughout the order-to-cash process.

Copyright © 2025, Oracle and/or its affiliates

Profiles, Segments and Strategies

Pricing Profiles:
Use a pricing profile to describe the buying ***characteristics of each of your customers***.

Pricing Segments:
Use a pricing segment to ***categorize sets of customers***, understand their business motivations, and offer a pricing solution. Use it to track pricing performance and analyze similar customer situations to help you improve revenue and margin. Eg: Corporate segment, international segment, and a domestic segment.

Pricing compares the pricing profile to each row of the pricing matrix until it finds a match. If more than one row matches, then Pricing uses the row that contains the lowest value in the Precedence.

Pricing Strategy:
A pricing strategy is a ***set of pricing rules*** that you set up to achieve a profitability goal for selling and pricing an item.

The pricing strategy specifies the price, cost, discount, currency conversion, shipping rules, and return price that Pricing uses to help meet the pricing objective of the pricing strategy.

Copyright © 2025, Oracle and/or its affiliates

Customer Pricing Profile and Segment

Pricing Profile

Long established customers

Medium sized customer

New Customer

Customer	Revenue Potential	Customer Size	Cost to Serve	Customer Value	Customer Rating
Computer Service and Rentals	Very High	Large	Low	Very High	Very High
Professional Computing Solutions	Very High	Large	Medium	Very High	Very High
Computer Associates International	High	Medium	High	Medium	High
Computers Direct to U	Low	Small	Low	Low	Medium

Pricing Segment

Revenue Potential	Customer Size	Cost to Serve	Customer Value	Customer Rating	Pricing Segment
Very High	Large	Low	Very High	Very High	Corporate Segment
High	Medium	High	Medium	High	Medium Enterprise
Low	Small	Low	Low	Medium	Small Enterprise Segment

Copyright © 2025, Oracle and/or its affiliates

Pricing Strategy

A pricing strategy is a set of pricing rules that you set up to achieve a profitability goal for selling and pricing an item. The pricing strategy can include various pricing rules.

- Price List
- Cost List
- Discount List
- Shipping charge List
- Return Price List
- Currency Conversion List

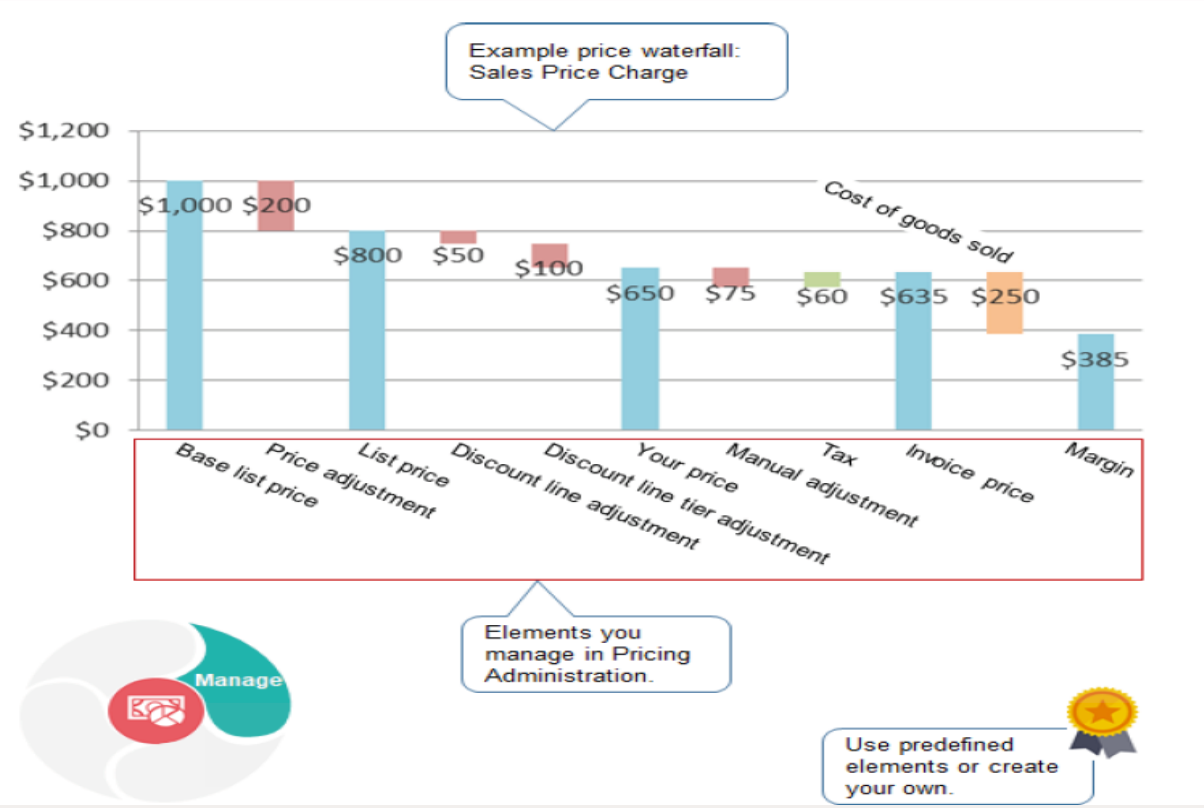

✓ The pricing strategy allows you to indicate if Price List Override is allowed

✓ The pricing strategy allows you to indicate if Currency Override is allowed

Copyright © 2025, Oracle and/or its affiliates

Price Elements and Pricing Rules

A price element is an object that a pricing algorithm uses to capture different types of prices, costs, adjustments, taxes, or profit margins that it requires to create a price breakdown or pricing analytic. Base List Price, Net Price Plus Tax, and Margin are each an example of a price element.

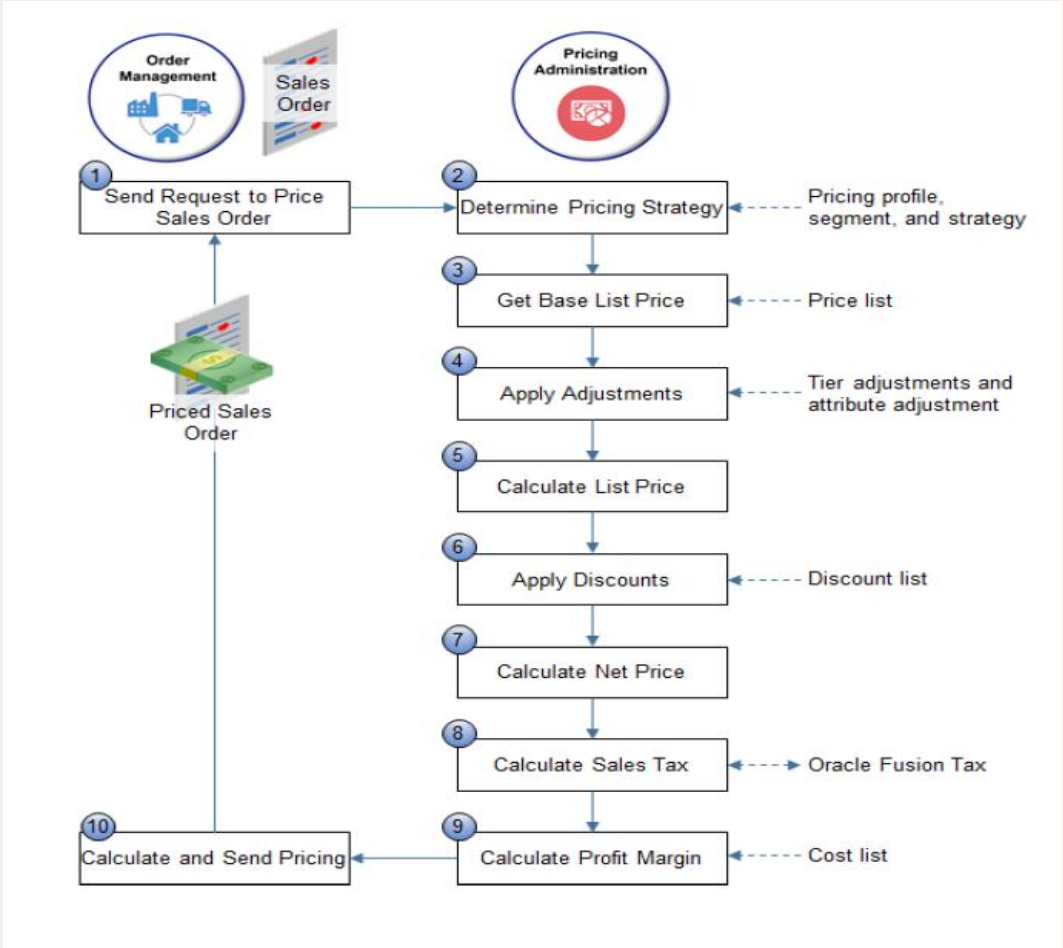

The various price elements get a value using one or more of Pricing Rules:

- ✓ Price Lists
- ✓ Discount Lists
- ✓ Cost Lists
- ✓ Currency conversion lists
- ✓ Shipping charge lists

Copyright © 2025, Oracle and/or its affiliates

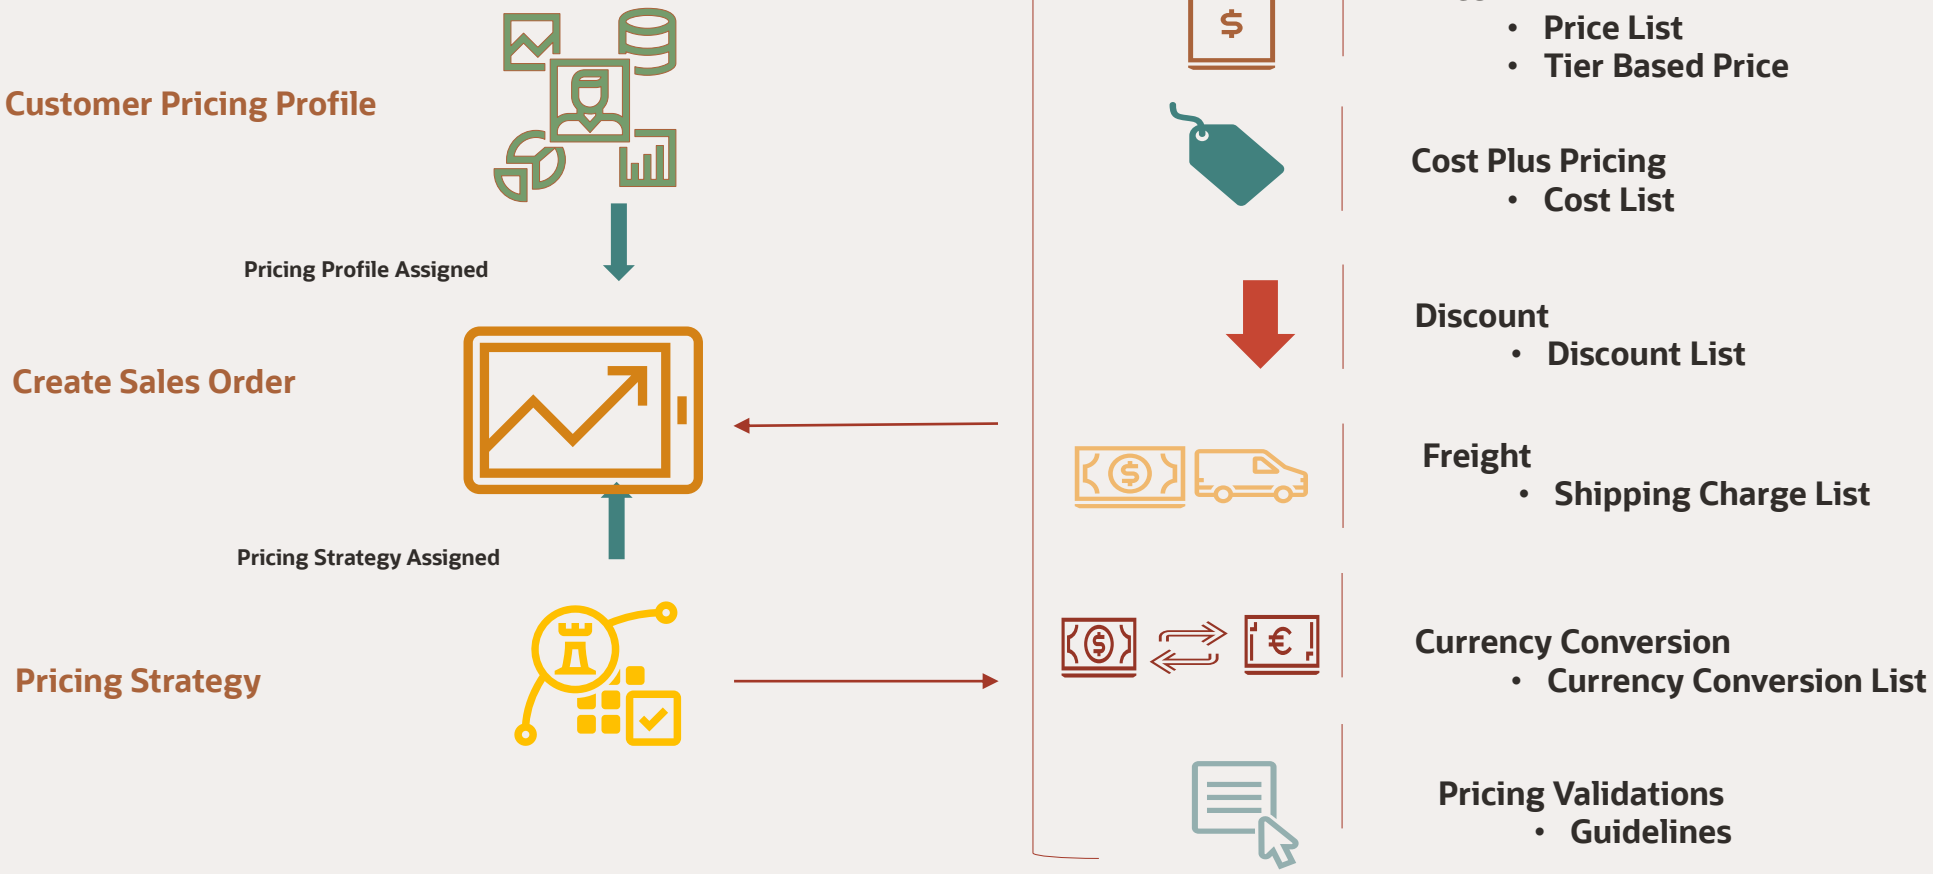

Pricing Sales Orders

Copyright © 2025, Oracle and/or its affiliates

Pricing– Demo

Vision captures orders in multiple currencies. It wants to implement various pricing strategies based on customer profile. Price on sales orders need to be based on strategy associated with the customer.. It also wants to prevent end users from giving excessive discounts

Copyright © 2025, Oracle and/or its affiliates

Price Lists

Price Lists are defined collection of prices for items and services targeted for a set of customers for a specific period.

Price List Type	Description
Segment	Contains the pricing for a given segment. You typically capture your list prices here
GSA	Used for U.S. General Services Administration (GSA) customers
Ceiling	Captures the highest prices for your items in the ceiling price list and uses them as a reference
Floor	Captures the floor (lowest) prices for items

Charges

- ✓ You can define charges to calculate the base list price for items and services.
- ✓ An item might include more than one charge, such as a one-time sale charge and an administration charge. You can create a pricing charge definition that adds a handling fee to this item.
- ✓ Support various types of adjustments for each charge:
  - ❑ Manual
  - ❑ Tier based
  - ❑ Attribute based

Calculation method for charges:

- Price
- Cost
- Covered item cost percentage

Options for creating and updating Price Lists:

- FBDI
- ADFdi
- Manually

Pricing – Use Case

Vision charges the customer a flat amount of $ 100 for each laptop item it sells. But for customers who order in bulk it also provides differential pricing based on the quantity ordered. The more the number of units ordered it provides better pricing for each unit.

Laptop – 15.6 “

Base Price = 100 USD

Tiered Pricing Requirement	
Order between 1-5	Price reduction adjustment = $5 per unit
Order between 6-10	Price adjustment = $10 per unit
Order anything more than 10	Price adjustment = $15 per unit

Scenario – All vs Highest Tier

Order quantity = 14

Pricing Calculation	Minimum	Maximum	All Tiers	Highest Tier
Tier 1	1	5	5 qty @ $5 adjusted price	NA
Tier 2	6	10	5 qty @ $10 adjusted price	NA
Tier 3	11	NA	4 qty @ $15 adjusted price	14 @ $15 adjusted price

Discount Lists

Discount list is a container of rules for defining discounts.

- The discounts can be seasonal discounts, volume discounts according to price or quantity.
- The discount applied can be flat rate or percent based.
- Apply attribute-based discount using pricing matrix

Support various types of adjustments for each charge:

- ❑ Manual
- ❑ Tier based
- ❑ Attribute based

Cost Lists

Cost list can be used to setup cost plus pricing. Cost list can be used to setup charges like item cost, sales commission, labor cost etc. Cost lists allow to manage and optimize charges and profit margins for the item.

Cost plus pricing : If you use cost plus pricing, then Oracle Fusion Pricing calculates the item price according to attributes you set on the price list and the cost list. The cost of an item is the sum of the charges that you define for the item on these lists.

Price Orders – Infrastructure Components

Service Mappings:
Integrate with the calling application that requires pricing, such as Order Management Cloud. Map inputs from the calling application to outputs that the matrix and algorithm can use.

Set up attributes so rules in the pricing matrix can use them.
Set up services and pricing entities to provide structure for variables that the pricing algorithm uses.

Pricing Matrix:
Set up conditions and dimensions in the pricing matrix.

Choose attributes in the condition and result columns of the matrix class from the entity attributes you set up in the service mapping.

The algorithm uses condition dimensions and their values to compare the runtime value against the value of the design time rule. The result values are the result of evaluating the conditions.

Pricing Algorithm:
Set up the algorithm so it uses the pricing matrix to evaluate and apply pricing rules at run time.

Set up the algorithm to transform the attribute values it receives from the service mapping to output values.

Technologies to Manage Pricing Rules

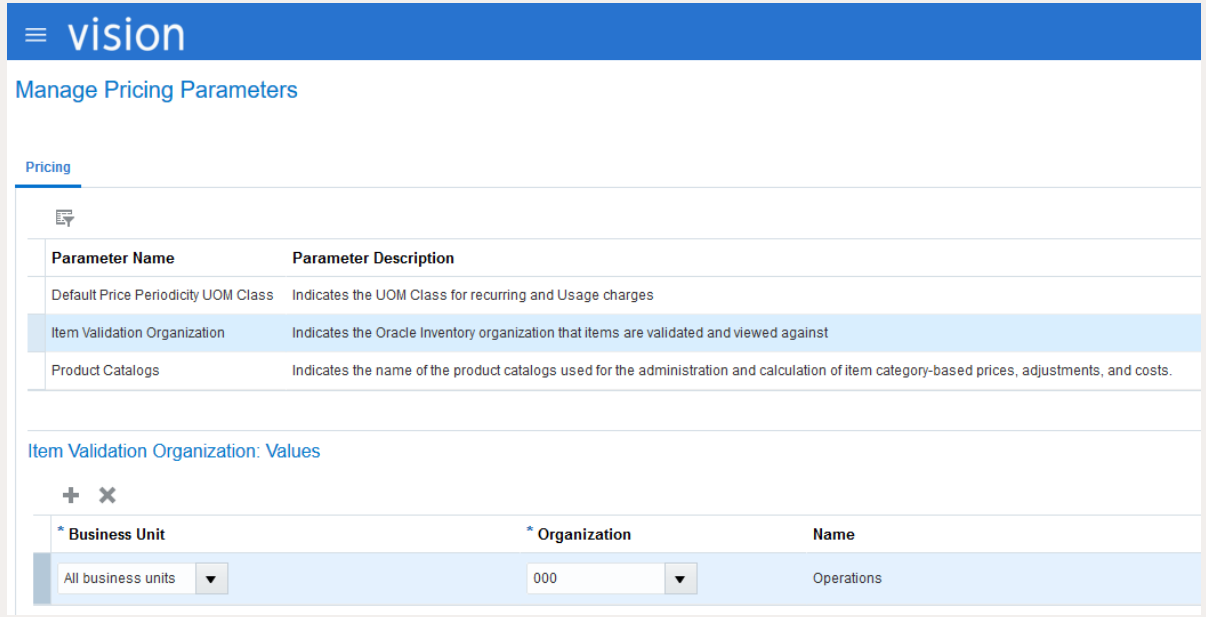

Technology	Description
Pricing Import Spreadsheet with File-Based Data Import	Use pricing import spreadsheets to import, migrate, or convert your data. They provide superior performance, even when importing a large amount of data, but you can't modify the template. If you must do a lot of modification, consider using REST API. For details, see the Import Price Lists topic.
Pricing Spreadsheet with ADF Desktop Integration	Use interactive spreadsheets to maintain and update your data. They're interactive, so you can search and download data, and, if you encounter an error, you can fix it and resubmit, but they don't perform as well as File-Based Data Import when you must manage a large amount of data. If you need to automatically import data from your source system into Pricing, then use File-Based Data Import or REST API instead. For details, see the Pricing Spreadsheets topic.
REST API	Use this industry standard technology to integrate with your systems, such as in a Platform as a Service (PaaS) environment, but it doesn't perform as well as File-Based Data Import when must manage a large amount of data. If you create a sales order, submit it, and modify the price list that you use to price the sales order, then you can't use REST API to update pricing on the sales order with the modified price list.
Pricing Administration work area	Use this graphical, easy to use interface, and there's almost no set up you can't do, but you must do all your data management manually. If you prefer to automate, consider using File-Based Data Import. For details, see the various topics in Administering Pricing.

Implementation Considerations

Setups

- ✓ Master Data – Customers, Items, Pricing
- ✓ PIM – Items with corresponding attributes set

Copyright © 2025, Oracle and/or its affiliates

Agenda

- Order to Cash Overview
- Returns Process
- Multi Channel Order Capture
- Validate and Transform Orders
- Price Orders
- **Promise Orders**

Copyright © 2025, Oracle and/or its affiliates

Promise Orders

Effective order promising can “save the sale” when a fixed lead time promise date would have been too conservative, or when current stock is limited, but more can be produced, transferred or bought to meet demand. Just as importantly, it can prevent unrealistic promise dates that lead to late deliveries, especially in complex fulfillment scenarios. When orders are booked availability checks and Promising results are performed to provide accurate details to the customer service personnel.

Key Order Management New Features – 25A

✓ Order Management

- Redwood: Create Documents for Sales Orders
- Redwood: Refine Search on Sales Orders
- Redwood: Reserve and Unreserve Multiple Order Lines
- Redwood: Update Multiple Order Lines
- Redwood: View Availability Details in Order Management
- Use Lots and Serials That Aren't in Sequence for Return Orders
- Redwood: Apply Promotions According to the Sales Order's Attributes
- Capture Actual Delivery Date for a Shipment
- Specify Pricing Dates on Sales Orders

✓ Pricing

- Evaluate Block Pricing Tiers Across All Lines
- Redwood: Apply Promotions According to Items on Sales Orders
- Redwood: Create Promotions That Add Free Items
- Redwood: Manage Discount Lists
- Redwood: Search for Pricing Promotions
- Redwood: Use Generative AI to Create Your Pricing Promotion's Description
- Use Closed Lines to Help Price Items

Copyright © 2025, Oracle and/or its affiliates

Key Order Management New Features – 24D

✓ Order Management

- Redwood: Search and Apply Actions on Multiple Sales Orders
- Redwood: Create and Manage Sales Orders
- Copy Orders That Have Integrated Subscriptions and Coverages
- Negotiate Rate Plans in Order Management

✓ Pricing

- Redwood: Apply Pricing Promotions According to Pricing Strategies and Payment Terms
- Redwood: Copy and Delete Pricing Promotions
- Reset Pricing Algorithms to the Predefined Version
- Use Amounts in the Transaction Currency to Calculate Tax

✓ Readiness Pages
